

PROJECT CONCEPT NOTE

CARBON OFFSET UNIT (CoU) PROJECT

Title: Gelson Solar Power Generation PoA, Gujarat

Version 1.0

Date 05/11/2021

First Issuance Period: 01/01/2018-31/12/2021

Monitoring Period: 29/11/2018 to 03/11/2021

Period: 3 years 11 months

Project Concept Note (PCN)
CARBON OFFSET UNIT (CoU) PROJECT

BASIC INFORMATION

Title of the project activity	Gelson Solar Power Generation PoA, Gujarat
Scale of the project activity	Small Scale
Completion date of the PCN	05/11/2021
Project participants	Gelson Corporate Pvt. Ltd., Gandhinagar, Gujarat, India
Host Party	India
Applied methodologies and standardized baselines	Type I (Renewable Energy Projects) Category AMS I.D.: "Grid connected renewable electricity generation" Sectoral Scope: 01 UCR Protocol Standard Baseline
Sectoral scopes	01 Energy industries (Renewable/NonRenewable Sources)
Estimated amount of total GHG emission reductions over the crediting period	6989 CoUs (6989 tCO _{2eq} /yr)

SECTION A. Description of project activity

A.1. Purpose and general description of Carbon offset Unit (CoU) project activity >>

The project **Gelson Solar Power Generation PoA, Gujarat** is located in various cities across State Gujarat, India.

The details of the registered project are as follows:

Purpose of the project activity:

The UCR Programme of Activities (PoA), “**Gelson Solar Power Generation PoA, Gujarat** ” (hereafter referred to as PoA) involves the installation of 520 small scale grid connected solar power plants with a total capacity of 3.886 MW in State: Gujarat, with the objective to contribute and promote generation of renewable energy in India. The commissioning date of the PoA is 29/11/2018.

The technological provider of this PoA is Gelsons Corporate Pvt Ltd (hereafter “Gelson”). This PoA is a voluntary initiative implemented by Gelson. Power is generated using solar energy involving solar only and not PV Hybrid systems combining solar and other renewable sources which are not part of this project activity.

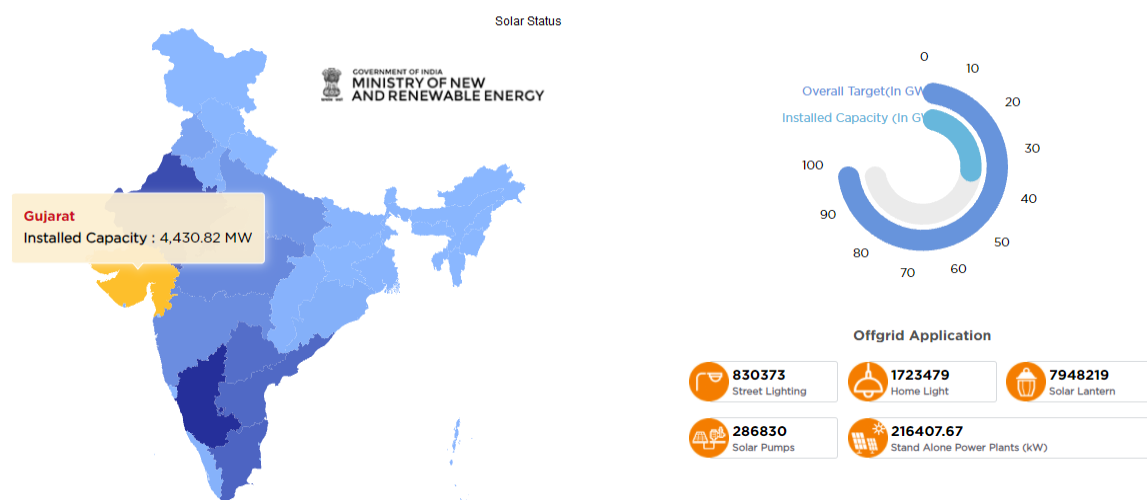

The electricity generated from grid connected solar power plants in each of the small scale project activities under this PoA is supplied to the regional grid and thereby displaces equivalent generation from grid connected thermal power plants. The owners of solar power plants are the Owner(s) of UCR Programme of Activities (PoA) and shall be addressed as ‘PoA implementer(s)’ in this PoA. The scheme after implementation will result in reduction of GHG emissions from power plants connected to the regional grid.

The project activity will generate power through solar PV technology and displace equivalent amount of power from the regional grid, thereby contributing towards the reduction in greenhouse gas emission due to generation of electricity in the regional grids in India. Thus, the PoA results in annual reduction in GHG emissions and hence mitigation of global warming.

In absence of the PoA, equivalent power would have been generated by the existing grid connected power plants and addition of new generation sources. The baseline to the PoA is therefore the electricity generated by the operation of existing grid-connected power plants and by the addition of new generation sources to the Grid.

Solar energy gathered by photovoltaic solar panels, intended for delivery to a power grid, must be conditioned, or processed for use, by a grid-connected inverter. Fundamentally, an inverter changes the DC input voltage from the PV to AC voltage for the grid. This inverter sits between the solar array and the grid, draws energy from each, and may be a large stand-alone unit or may be a collection of small inverters, each physically attached to individual solar panels. The inverter must monitor grid voltage, waveform, and frequency. One reason for monitoring is if the grid is dead or strays too far out of its nominal specifications, the inverter must not pass along any solar energy. An inverter connected to a malfunctioning power line will automatically disconnect in accordance with safety rules, for example UL1741, which vary by jurisdiction. Another reason for the inverter monitoring the grid is because for normal operation the inverter must synchronize with the grid waveform, and produce a voltage slightly higher than the grid itself, in order for energy to smoothly flow outward from the solar array.

There are no National or sectoral policies which gave any competitive advantages to solar power generation which have been implemented prior to 11 November 2001 and neither has there been any policies which provide any advantage to more emission intensive technologies which have been implemented after 11 December 1997.

India has installed 42.3 GW of cumulative grid-connected solar capacity, with additions led by Karnataka (7,409 MW), Rajasthan (6,581 MW), and Gujarat (5,132 MW). India has installed 96.95 GW of cumulative grid-interactive renewable energy capacity (excluding large hydro) as of June 30, 2021, in the country, against the ‘175 GW by 2022’ target.

Rooftop solar adoption has not gathered the desired momentum in India despite the government push. Major reasons are policy conundrums, ill-designed institutional and governance structures, distorted market mechanisms, and technical challenges such as those involving grid connectivity.

Most of the state regulations on net metering set the maximum capacity limit at 1 MW per metering point for rooftop solar systems to be connected to the distribution grid, which hinders large-scale deployment. Often this capacity ceiling is imposed based on the poor financial health of the distribution utilities. These arbitrary caps impede the uptake of rooftop PV.

Rooftop solar systems require bottom-up approaches focusing on intense consumer engagement, the current policy and regulatory regime is designed based on a top-down approach with a uniform set of policies and regulations that lack flexibility. The most recent evidence of such policy-level obstruction is the withdrawal of net metering policies in certain states for commercial and industrial consumers. There is no adequate understanding of how the existing intervention types perform in varying policy, regulatory, and governance environments. A solar roof is currently an expensive option as it requires more components, and customers who intend to set up this system must have a new roof exclusively for installation or must invest in a raised structure for installation.

A.2 Do no harm or Impact test of the project activity>>

There are social, environmental, economic and technological benefits which contribute to sustainable development.

- **Social benefits:**

- The project activity has led to employment generation during installation as well as operation phase of the project activity. Direct & indirect employment is generated for the project implementation & management.
- The success of this project will encourage more businesses to develop and encourage other owners with rooftops and open spaces to install such systems and earn discounts from carbon revenue earning of the technology provider.
- Technology providers will now be able to offer further discounts to the installation of the panels and thereby promote solar panels in the region with faster payback periods for owners. This lack of solar rooftop installation information is further compounded by the high upfront capital cost to deploy these systems, as these are often not within reach of the larger section of the society. Although there has been a dramatic reduction in the rooftop solar system cost in recent years, the initial cost continues to be a major hurdle even for small projects.

- **Environmental benefits:**

- The project contributes to the general wellbeing of the region and is in line with the sustainable development policies of India.
- Solar energy sector in India has emerged as a significant player in the grid connected power generation capacity over the years. It supports the government agenda of sustainable growth, while, emerging as an integral part of the solution to meet the nation's energy needs and an essential player for energy security.
- Clean and renewable source of energy.

- **Economic benefits:**

- Grid interconnection of photovoltaic (PV) power generation systems has the advantage of effective utilization of generated power because there are no storage losses involved.
- Helps in scaling up of grid connected solar power projects from 20,000 MW by the year 2021-22, to 1,00,000 MW by the year 2021-22 under India's National Solar Mission.
Provides employment to local communities through construction and maintenance of units.

- Out of the total rooftop solar installations in the country, the residential sector has been the worst performer, at 16%, compared to other competing sectors such as industrial and commercial. Hence revenues from carbon credits will help faster adoption of such projects in the rooftop residential sector.
- Banks and financial institutions are reluctant to lend funding for these projects due to their small scale. Traditionally, banks charge a high interest rate to developers (10%–12%, or up to 14%) depending upon the associated risks, nature of the project, and the borrower's credit rating. With revenue from carbon credits, it is hoped that the technology providers will lower the costs of installation and thereby reduce the loan payback period. Solar financing is still a very complicated procedure in India and isn't very widely available. Barring a few nationalized banks, no other banks have a dedicated vertical for the solar plant. Often, private banks in the country overlook the ROI aspect of the plant and assess the asset purely based on the creditworthiness of the client. Carbon revenue will help alleviate such issues.

A.3. Location of project activity >>

Country: India.

State: Gujarat

A.4. Technologies/measures >>

Photovoltaic module consists of several photovoltaic cells connected by circuits and sealed in an environmentally protective laminate, which forms the fundamental building blocks of the complete

PV generating unit. Several PV panels mounted on a frame are termed as PV Array. Crystalline or thin film type PV modules or a combination of both shall be used. Inverter, Switchgear Cubicle for Grid Connection, Circuit Breaker and Transformer of suitable capacity would be installed; details of the same would be provided at PoA level.

Each power production unit will in general constitute the following equipment:

1. Solar Photovoltaic modules
2. Inverters
3. Transformers
4. Circuit breakers
5. Mounting structures
6. Cables and hardware.
7. Junction box and distribution boxes.
8. Earthing kit.
9. Control room equipment.
10. System for control and monitoring.
11. Evacuation system

The technology used does not pose any threat to the environment in comparison to the fossil fuel-fired power plants. The technology to be applied in the project activity is proven technology and can hence be considered safe and sound technology. The project does not involve any transfer of technology from any Annex 1 country. There is no Public funding (ODA and/ or Annex I countries) for the PoA.

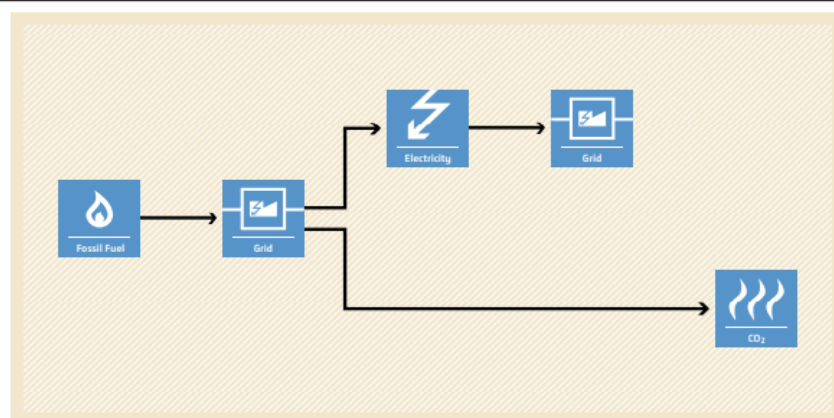

A.5. Parties and project participants >>

Party (Host)	Participants
India	Gelson Corporate Pvt. Ltd., Gandhinagar, Gujarat, India

A.6. Baseline Emissions>>

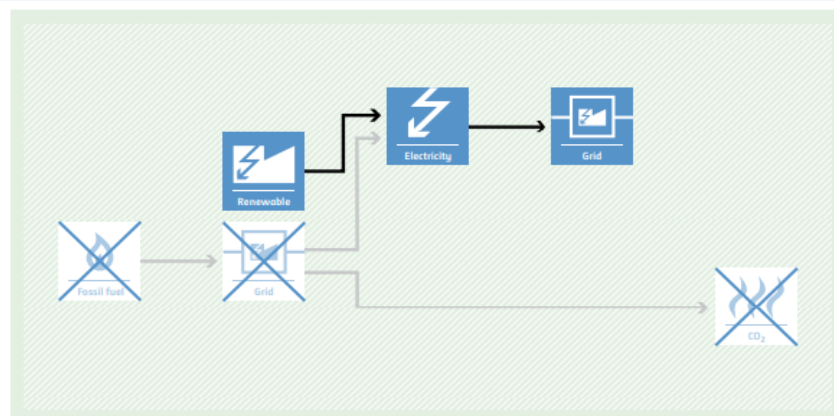

BASILINE SCENARIO

Electricity provided to the grid by more-GHG-intensive means.

PROJECT SCENARIO

Electricity is generated and supplied to the grid using renewable energy technologies.

The baseline scenario identified at the PCN stage of the project activity is:

- the electricity delivered to the grid by the project activity that would have otherwise been generated by the operation of grid-connected power plants and by the addition of new generation sources into the grid.

The PoA comprises of a renewable energy generation through installation of solar photovoltaic modules and displaces electricity from the regional grid either by supplying to the grid itself or by supplying power to an identified consumer through the regional grid.

A.7. Debundling>>

This PoA is not a debundled component of a larger carbon or GHG registered project activity.

SECTION B. Application of methodologies and standardized baselines

B.1. References to methodologies and standardized baselines >>

SECTORAL SCOPE - 01 Energy industries (Renewable/Non-renewable sources)

TYPE I - Renewable Energy Projects

CATEGORY- AMS-I.D. - “Grid connected renewable electricity generation”

This methodology comprises of activities that include the construction and operation of a power plant that uses renewable energy sources and supplies electricity to the grid (Greenfield power plant).

B.2. Applicability of methodologies and standardized baselines >>

This project is included within the UCR Standard Positive List of technologies and are within the small-scale CDM thresholds (e.g. installed capacity up to 15 MW). The positive list comprises of: (a) The grid-connected renewable electricity generation technologies of installed capacity up to 15 MW, (b) Solar technologies (photovoltaic and solar thermal electricity generation);

POA involves installation of grid-connected solar photovoltaic power generation with individual CPA capacities less than or equal to 15 MW. The rated capacity of the power plant(s) is limited to 3.886MWe

All the CPAs included in the POA are within the geographical boundaries of India. Each solar power generation unit is uniquely defined with GPS coordinates from which the relevant Indian state and the relevant regional grid (NEWNE or Southern grid) can be uniquely identified.

The aggregator has assigned a Unique Identification Number to each PoA installation and the same will be mentioned in the Monitoring Report. Furthermore, the SSC- CPA will be identified by its geographical coordinates. This will ensure that there occurs no double counting and that the status of verification can be checked at anytime. The CPAs will not be part of any other registered PoA or individual non UCR project activities. A declaration in this regard will be obtained from the CPA implementer and the same can be verified by the UCR verifier.

The technology/measure allowed under PoA is grid connected Solar PV based generation systems which will displace equivalent quantity of electricity from the regional grid in India. The testing/certifications; total capacity of each CPA will not exceed 15MW. All the equipment of each CPA will be complying with applicable national/ international standards. The above details may be verified from one or more of the following documents:

- ☐ Technology Specification provided by the technology supplier
- ☐ Purchase order copies
- ☐ EPC contracts
- ☐ Power purchase agreement
- ☐ Project commissioning certificates

The PoA is a voluntary coordinated action

The POA covers only grid connected solar power generation with capacities less than or equal to 15 MW, hence , only the capacity of each PoA needs to be ascertained at the time of PoA inclusion to ensure that the capacity is within the limits described above.

As per the Ministry of Environment and Forest (MoEF), Govt. of India Office Memorandum dated 13/05/2011, it had received specific clarification regarding the applicability of EIA Notification, 2006 in respect of Solar Photo Voltaic (PV) Power plants. It was further clarified in the above memorandum that both Solar PV power projects are not covered under the ambit of EIA Notification, 2006 and no environment clearance is required for such projects under provisions thereof.

The PoA comprises of a renewable energy generation through installation of solar photovoltaic modules and will displace electricity from the regional grid by supplying to the grid itself. Hence this methodology is applicable and fulfilled.

The PoA is not implementing any hydro power plant. The PoA is not implementing any cogeneration system. The proposed PoA is not implementing any biomass project activities. The PoA implements green field solar power plants and does not involve capacity addition.

The PoA involves installation of new power plants at listed sites where there was no renewable energy power plant operating prior to implementation of project.

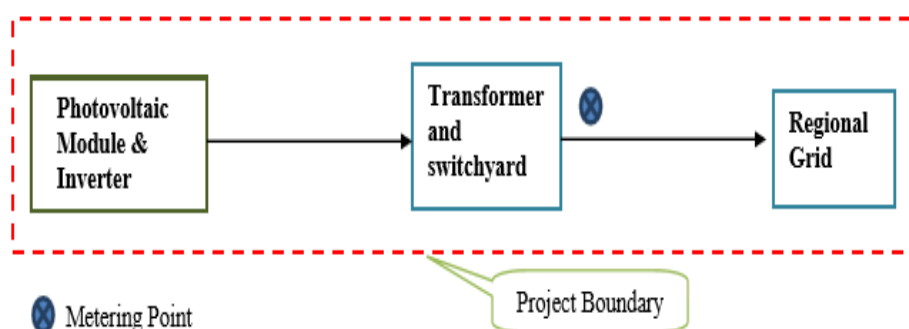

The PoA implemented is green field solar power plants and not a retrofit or replacement activity.

B.3. Applicability of double counting emission reductions >>

Each of the PoA has a unique ID and meter, which is visible at each of the sites. The Monitoring Report has the details of the end user's name and the location i.e. District, Mandal, village in which it is constructed along with the Unique ID. A database of all the PoA is maintained by Gelson and is regularly updated to avoid any double counting.

B.4. Project boundary, sources and greenhouse gases (GHGs)>>

The project boundary encompasses the physical, geographical site of the solar power plant, the energy metering equipment and the connected regional electricity grid.

	Source	GHG	Included?	Justification/Explanation
Baseline	Grid-connected electricity	CO ₂	Included	Major source of emission
		CH ₄	Excluded	Excluded for simplification. This is conservative
		N ₂ O	Excluded	Excluded for simplification. This is conservative
Project Activity	Greenfield solar power project	CO ₂	Excluded	Excluded for simplification. This is conservative
		CH ₄	Excluded	Excluded for simplification. This is conservative
		N ₂ O	Excluded	Excluded for simplification. This is conservative

Leakage Emissions is not applicable.

B.5. Establishment and description of baseline scenario (UCR Protocol) >>

The baseline scenario is that the electricity delivered to the grid by the project activity would have otherwise been generated by the operation of grid-connected power plants and by the addition of new generation sources into the grid.

PoA implementer(s): 520

Commissioning Date of first PoA installation: 29/11/2018

Estimated Annual Emission Reductions: $BE_y = EG_{BL,y} \times EF_{CO_2, GRID, y}$

BE_y = Emission reductions in a year y.

where:

$EG_{BL,y}$ = Quantity of net electricity supplied to the grid as a result of the implementation of the UCR project activity in year y (MWh)

$EF_{Grid, CO_2, y}$ = CO₂ emission factor of the grid in year y (t CO₂/MWh) as determined by the UCR Standard.

Estimated total baseline emission reductions (BE_y) = 6989 CoUs (6989 tCO_{2eq})

B.6. Prior History>>

The PoA has not applied to any other GHG program for generation or issuance of carbon offsets or credits.

B.7. Changes to start date of crediting period >>

There is no change in the start date of crediting period.

B.8. Permanent changes from PCN monitoring plan, applied methodology or applied standardized baseline >>

There are no permanent changes from registered PCN monitoring plan and applied methodology

B.9. Monitoring period number and duration>>

First Issuance Period: 01/01/2018-31/12/2021

Monitoring Period: 29/11/2018 to 03/11/2021

Period: 3 years 11 months

B.8. Monitoring plan>>

Key Data Monitored: • Quantity of net electricity supplied to the grid

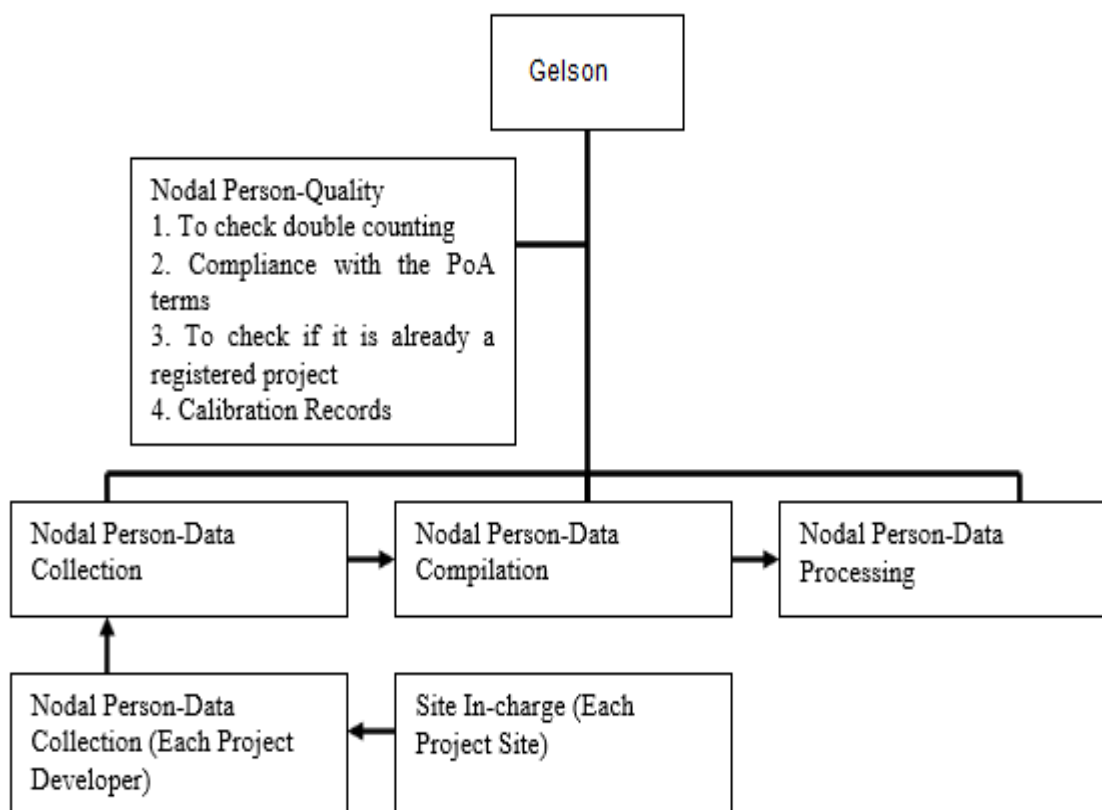

1. Monitoring Plan Objective and Organization

Gelson is the project implementer and monitors the electricity delivered to the electricity grid by the respective PoA. The data is already archived electronically and is stored since 2018.

To ensure that the data is reliable and transparent, the project implementer has established Quality Assurance and Quality Control (QA&QC) measures to effectively control and manage data reading, recording, auditing as well as archiving data and all relevant documents. The data is monitored on a daily basis and is submitted to Gelson on a monthly basis.

Gelson has implemented QA&QC measures to calibrate and ensure the accuracy of metering and safety aspects of the project operation. The metering devices are calibrated and inspected properly and periodically, according to state electricity board's specifications and requirements to ensure accuracy in the readings.

The record keeping system follows the hierarchy given below:

Data / Parameter:	EGy
Data unit:	MWh
Description:	Quantity of net electricity supplied by the PoA to the grid in year y
Source of data:	Statement of net export of power to the grid issued Monthly by State Electricity Board or any other competent authority as applicable
Measurement procedures (if any):	To be specified in each PoA
Monitoring frequency:	<p>The net energy exported to the grid is measured every month using calibrated energy meter by the State Electricity Board authorities in the presence of the project implementer or its representatives. The meter/s shall be jointly inspected, and sealed by authorised representatives of the company and the state utility.</p> <p>Measuring procedure: Will be measured by an export-import energy meter. The net electricity exported by the project plant would either be directly sourced as a measured parameter or be calculated by deducting the amount of imported electricity from the total amount of exported electricity.</p> <p>Accuracy class of energy meter: As per Power Purchase Agreement (PPA) or relevant National standards amended/modified from time to time.</p> <p>Calibration Frequency: As per the Central Electricity Authority the testing and calibration frequency should be minimum once in five years. However, the calibration will be done following the relevant applicable National Guidelines updated from time to time during the operation of the CPAs.</p> <p>Entity responsible: Aggregator</p>
QA/QC procedures:	<p>Monitoring frequency: Continuous</p> <p>Measurement frequency: Hourly</p> <p>Recording frequency: Monthly</p> <p>The electricity meter/s record both export and import of electricity from the solar Power plant and the readings with regard to net electricity generated will be used for calculation of emission reductions. The net electricity supplied to the grid will be cross checked with the monthly invoices. The meter/s would be checked for accuracy and the meters will be calibrated as per the procedures of State Electricity Board as per the national or international standards. Measurement results shall be cross checked with records for sold electricity (i.e. invoice).</p>
Purpose of Data	-Calculation of baseline emission

Data/Parameter	EF, CO ₂ , GRID, y
Data unit	tCO ₂ /MWh
Description	Fixed Ex-Ante
of data	UCR Standard Protocol
Value(s) applied	As per Standard
Measurement methods and procedures	Fixed
Monitoring frequency	NA
Purpose of data	To estimate baseline emissions
